<b>Key Words</b>	Distributed mechatronic system, feedback control, real-time control, modeling, mathematical-physical analysis
<b>Specification</b>	<p>Industrial production is more and more realized with increasing number of productive components generally mechanical, electromechanical, electrical or electronic ones. The components form usually one technological set. It can be manipulation, machining, quality checking, packing, etc. operations, in which the components represent individual or cooperative distributed system. For mentioned components above, the system is called mechatronic system.</p> <p>Such system can be controlled on different levels form simple manual and fixed control, via logical feedback control up to high-level continual feedback control. The issue is usually managing of several motor units (drives) to be worked in common time schedule.</p> <p>The aim of the theme is a design and technical documentation of feedback control, which provides automatic control of several independent model motor units.</p>
<b>Tasks</b>	<ol style="list-style-type: none"> <li>1. Study and select suitable feedback control for distributed mechatronic system.</li> <li>2. Compose mathematical description of individual model motor unit.</li> <li>3. Apply or implement selected feedback control in real-time in program-mable environment MATLAB-Simulink.</li> </ol>
